To do this, simply create a brush with a shape that is in any color you want to use, and then click Copy > Clone. Example: Brushes can be applied to almost any image in Photoshop. So, if you take an image and want to apply a brush, you must first make sure that the Brush Tool (B) is selected. You can use the Brush Tool (B) to select areas of a photo (ie: add a brush outline around a face, hair, or any other object). To select a brush, click on the Brush Tool (B). This will open the Brush Tool Options window. As you can see below, the Brush Settings box will contain your brush options (select). Example: A Brush can be applied to different areas of an image using the Brush Tool (B). However, unlike the Pen Tool (P), this tool does not allow you to outline edges. It works like a stencil, and allows you to fill any empty areas. To apply a brush, simply click anywhere in the desired area. In the image below, for example, you can see that I want to paint an outline around the girl's face. You can apply a brush to a layer by clicking on the 'Sample' icon in the Brush Options box. Just click anywhere in the layer to apply the brush or outline. A Fill Layer allows you to paint in areas that do not need brushes. For instance, if a person wants to create an outline around just a hair and a head, the person can create a Fill Layer with just the hair and the head of the person. This way, the person can draw just the head and hair easily, for example, with a pen tool. To draw the outline, you would press B and then click and drag around the head and hair. Brushes in Photoshop Brushes are available in three different types: standard, gradient and pattern. The brush size and opacity can be modified by left-clicking on a brush and selecting one of the size options or by pressing the mouse wheel while the brush is selected. By holding down the mouse button, you can increase or decrease the opacity of the brush. To change the size of the brush, move the mouse over the face of the brush and hold down the left or right mouse button to increase or decrease the size of the brush. To load a new brush, simply left-click on the brush to pick it from the brush palette. You can also use Photoshop's built-in save brush as an image options menu. You can save brushes as.PSD files by pressing Ctrl+S (Cmd+S for Macs). This will save the brush as a new Photoshop document. The name of the new document will be the name of the original brush with "brush" added to the end. For example, a "-Brush-" name will be saved. You can then modify or change the properties of the brush without having to copy and paste it from the brush palette each time. Please note that while you can delete a brush image file, it will not be removed from the canvas. It will be included in the.PSD file and you will still be able to access the original brush image file. You can create a new brush from an image by using the Brush Tool. The first thing you need to do is select a brush from the brush palette and set a brush size. The brush size can be modified by left-clicking on the brush, selecting a brush size from the brush size drop-down list and moving the mouse. Choose an image and place it on your canvas (Ctrl+G). Press Ctrl+B (Cmd+B for Macs) to select the Brush Tool. To set the brush size, left-click on the brush and select a brush size from the brush size drop-down list. You can change the brush's opacity by pressing the mouse wheel while the brush is selected. This will affect the opacity of the image that is created using the brush.
